Dietary guidelines by various health organizations

Nutrients	IOM/USDA	AHA	NCEP	WHO
Carbohydrate	45-65%			55-75%
Total fat	20-35%	<30%	<30%	15-30%
Saturated fatty acids	As low as possible (<10%)	<7%	<7%	<10%

Macronutrient composition of some popular diets

	Low-carb	Mediterranean	Low-fat
	Eat all you want of meat, dairy and veggies	Veggies, olive oil, nuts, seafood, wine, fruit, some meat/dairy	Whole grains & veggies; no meat
Examples	Atkins	Med. Diet	Ornish
Carbohydrates	10%	50%	70%
Fat	55-65%	35%	10%
Protein	20-30%	15%	20%

Average intake of saturated fat, by age and sex (National Diet & Nutrition Survey 2008/2009–2010/2011)

	Men		Women		
	19-64 y	≥65 y	19-64 y	≥65 y	
SFA (g/d)	28.8	29.3	22.0	23.2	
% total energy	12.0	13.6	12.0	13.7	

Mean intake is ~12-13% of total energy in both sexes

Markey O, et al. 2014. Nutr Bulletin

- <u>Natural foods</u> containing saturated fat also contain
 - Vitamins B1, B2, B6, B11, B12
 - Protein
 - Zinc
 - Magnesium
 - Retinol
 - Selenium
 - Calcium
 - Vitamin D

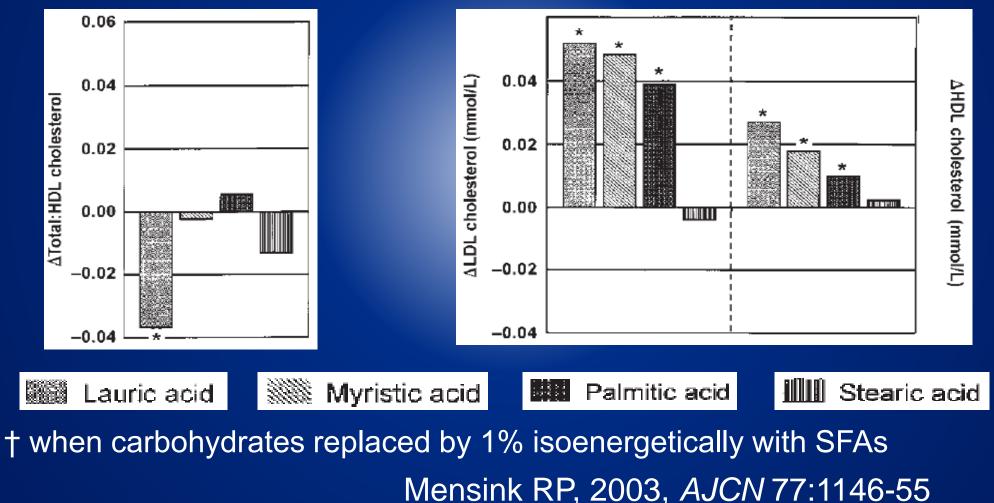

May result in inadequate intake of key nutrients in certain populations

Saturated fat and CV risk markers

Effect of saturated fatty acids on serum cholesterol [†]

Total Chol: HDL-C

LDL-C HDL-C

Low-fat vs low-carb on metabolic parameters: Meta-analysis of RCTs with >8wks follow-up

Bayesian Analysis

Between Group Differences ^a

	Mean (95% Crl	Probability LoCHO Superior	Probability LoFAT Superior
BMI kg/m ²	-0.6 (-1.5, 0.3)	90.1%	
Cholesterol (mg/dl)	9.6 (2.7, 16.4)		99.7%
HDL-C (mg/dl)	5.4 (3.5, 7.2)	> 99.9%	
LDL-C (mg/dl)	9.1 (3.0, 15.2)		99.8%

Mente A, et al, 2017, Lancet Diab Endocrinol

PURE: 135,335 from 667 communities in 18 (Phase 1) countries from 5 continents

Target: 200,000 people

Countries

Geog. region	Countries	Ν
South Asia	Bangladesh, India, Pakistan	29,560
China	China	42,152
Southeast Asia	Malaysia	10,038
Africa	South Africa, Zimbabwe	4,558
North America	Canada, Poland, Sweden,	14,916
Middle East	Iran, Occupied Palestinian Territory, Turkey, UAE	11,485
South America	Argentina, Brazil, Chile, Colombia	22,626
Overall		135,335

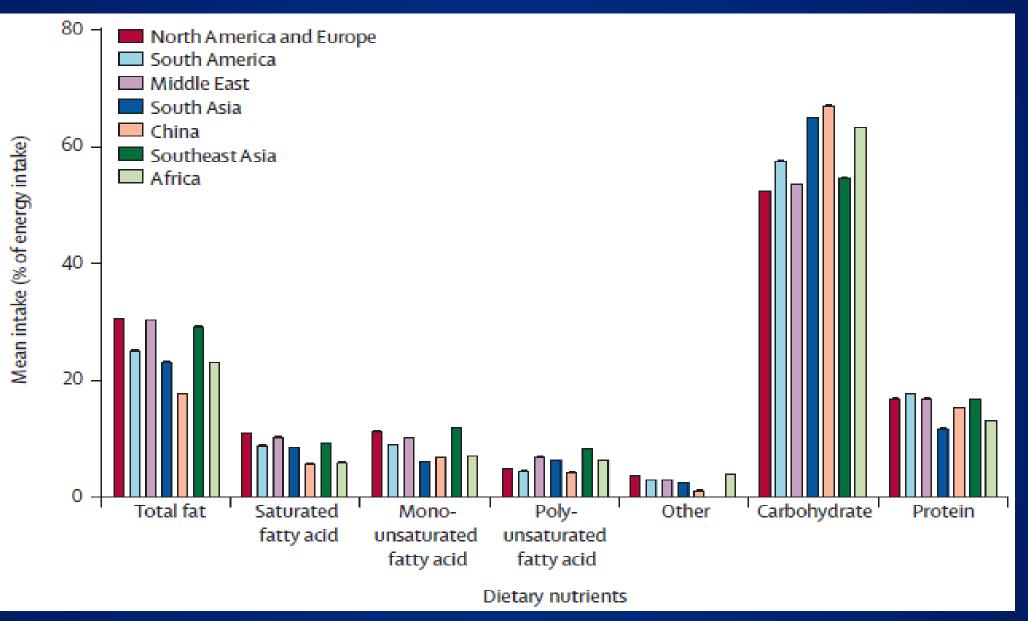

Study Methods

Design: Cross-sectional study

Population: Unbiased selection from general population in 667 urban/rural communities in 18 countries N=135,335; aged 35-70 years, without CVD at baseline **Diet:** Country-specific, validated food frequency questionnaires **Covariates:** Demographics, other lifestyle, health history, center **Outcomes:** Blood pressure (n=125,287); Blood lipids – LDL, HDL, TC/HDL ratio, Trig. (n=104,486); ApoB, ApoA & ApoB/ApoA ratio (n=18,330)

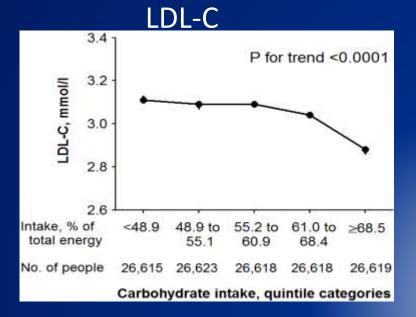

Statistical Analyses: Multivariable linear regression, with random effect models to account for community level clustering

Mean intake of nutrients by geographic region (n=125,287) +

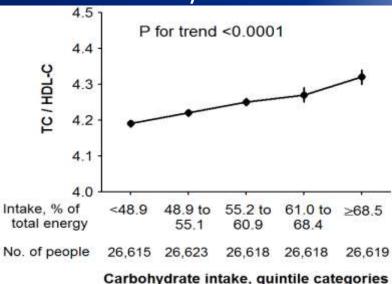

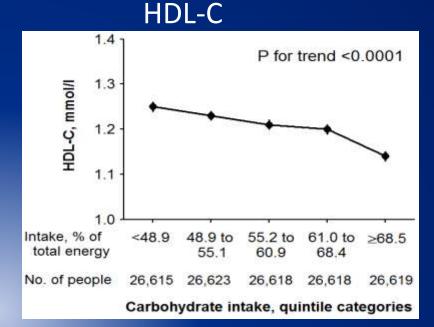

⁺ Means are adjusted for age, sex, and centre.

Carbohydrate intake versus risk markers

Saturated fat intake versus risk markers

ApoB

Systolic BP

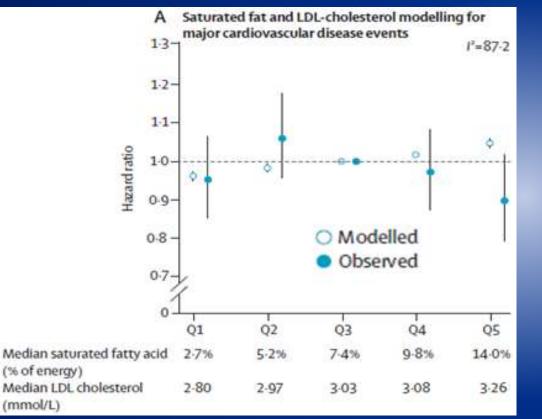

Simulation modelled versus observed hazard ratio of the association between sat. fat & CVD events

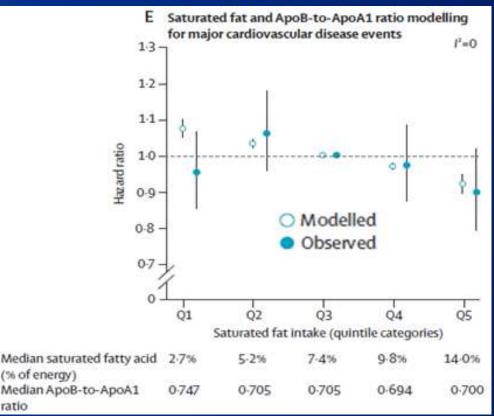

ratio

LDL-C

(mmol/L)

ApoB/ApoA

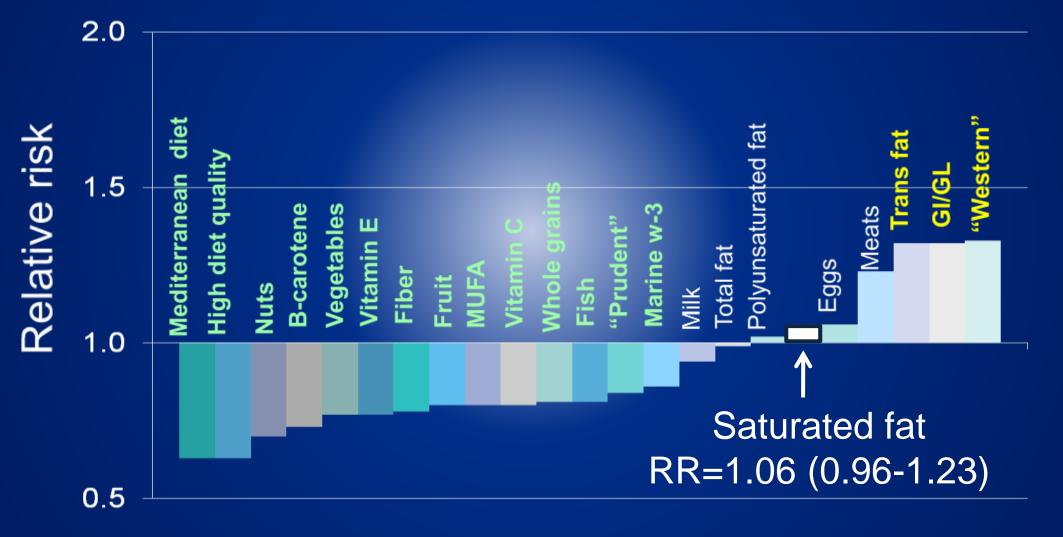

Conclusions

- Reducing sat. fat and replacing it with carbohydrate has an adverse effect on blood lipids
- Focusing on a single lipid marker (ie, LDL) alone does not capture the net clinical effects of nutrients on CVD risk
- Our data are at odds with current recommendations to reduce total fat and saturated fats

Saturated fat and cardiovascular disease

Hamley, 2017	5	1.06 (0.86, 1.31)

Summary of cohort studies and RCTs of saturated fat & clinical events

• Saturated fats are not associated with all cause mortality, CVD, CHD, stroke, or type 2 diabetes

 Replacing saturated fat with mostly n-6 PUFA is unlikely to reduce CHD events, CHD mortality or total mortality

Associations of fats and carbohydrate intake with cardiovascular disease and mortality in 18 countries from five continents (PURE): a prospective cohort study

Mahshid Dehghan, Andrew Mente, Xiaohe Zhang, Sumathi Swaminathan, Wei Li, Viswanathan Mohan, Romaina Iqbal, Rajesh Kumar, Edelweiss Wentzel-Viljoen, Annika Rosengren, Leela Itty Amma, Alvaro Avezum, Jephat Chifamba, Rafael Diaz, Rasha Khatib, Scott Lear, Patricio Lopez-Jaramillo, Xiaoyun Liu, Rajeev Gupta, Noushin Mohammadifard, Nan Gao, Aytekin Oguz, Anis Safura Ramli, Pamela Seron, Yi Sun, Andrzej Szuba, Lungiswa Tsolekile, Andreas Wielgosz, Rita Yusuf, Afzal Hussein Yusufali, Koon K Teo, Sumathy Rangarajan, Gilles Dagenais, Shrikant I Bangdiwala, Shofiqul Islam, Sonia S Anand, Salim Yusuf, on behalf of the Prospective Urban Rural Epidemiology (PURE) study investigators*

Dehghan M, et al, 2017, The Lancet

Study Methods

Design: Prospective cohort study **Population:** Unbiased selection from general population in 667 urban/rural communities in 18 countries N=135,335; aged 35-70 years, without CVD at baseline **Diet:** Country-specific, validated food frequency questionnaires **Covariates:** Demographics, other lifestyle, health history, center **Outcomes:** Major CVD (CV death and nonfatal MI, stroke, and heart failure) (n=4784), using standardized definitions; total mortality (n=5796) Follow-up: Median 7.4 years **Statistical analyses:** Multivariable Cox frailty analysis with study centre as random intercept

Strengths

- Prospective design, large, and covers 5 continents representing diverse diets globally
- Standardized and validated methods to measure diet using country specific food frequency questionnaire
- Extensively adjusted for dietary and non-dietary covariates

Limitations

- Random measurement error in assessment of diet; may dilute real associations
- High-carbohydrate and low-fat diets may be a proxy for poverty
- Unable to measure trans fat; data on vegetable oil use not included (separate paper)
- Fewer events within countries or regions

 Ongoing follow-up with larger sample size in PURE will provide clear answers by region

Conclusions and implications

- A high carbohydrate diet (>50-55%E) is associated with higher risk of mortality
- Fats, including saturated and unsaturated fats, are associated with lower risk of mortality
- No association between total fat, types of fat and CVD events

Fruit, vegetable, and legume intake, and cardiovascular disease and deaths in 18 countries (PURE): a prospective cohort study

0.6	0.8 1 1.2	P-trend= 0.0001	0.6	0.8 1 1.2 1	4 P-trend= 0.13

Conclusions and implications

 Current advice to limit total fat to <30%E and saturated fat to <10%E are not supported by this global study

CONCLUSION

 Foods containing SFA such as dairy and meat may be part of a healthy dietary pattern shown to reduce CVD (eg, 'Mediterranean diet')

• Focus on eating natural foods, reduce intake of refined or starchy carbohydrate foods, and be less concerned about targets for individual nutrients
